Video 4: NiFi System Architecture (01:10)

To illustrate ETL, we're going to be building a system. The system will follow the general pattern of ETL, as you can see here, we're going to have the source, we're then going to extract, transform and load. Now, we will be doing all of these components in containers to facilitate our setup. And so, we don't have to spend a whole week through what would be needed to do that. And so, the very first part is going to be a MySQL database. We will build a database inside of it and then some tables.

We will walk through all of those steps. The next part is going to be on a container on its own as well. And this will be NiFi. Through that, we will extract, we will do a transformation, and then we will view it inside of this platform as well. Now, in order for those pieces, those containers to see each other, we're going to be building a network as well. And so, that will be this external box. So, we will have two containers inside of a Docker network as well.
